

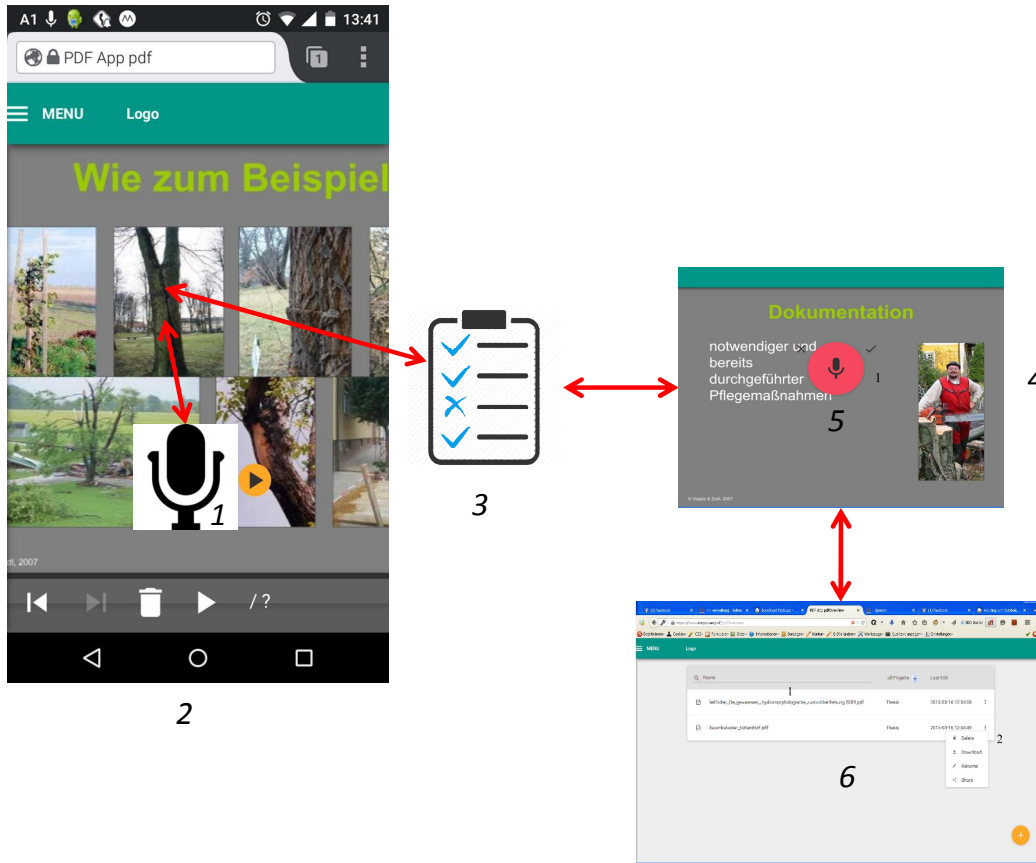

Fig. 4: Example of creation and sharing of integrated file, including checklists and voicetags on mobile device

- 1 Voice annotation or voice tag is combined to a file (e.g. photo from camera or gallery) on x,y level
- 2 Shows a screen of a mobile device
- 3 Checklists (or other files) can be integrated on x,y level thus creating a workflow which is linked to it
- 4 The workflow goes ahead; the single steps of the workflow can be fulfilled by different users,
- 5 the documentation is being embedded on the x,y level as described in (1)
- 6 shows a backend

The uniqueness of the invention lies in the integration of tags, files, workflows etc. into the original file. Spoken word often is better to explain tasks to be fulfilled and the combination of voice and files enables users to work similar to the real world situations where computers are used to support human voice with pictures or data.
